# Winning Space Race with Data Science

Gautham Krishna S  
18th February 2026

# Outline

---

- Executive Summary
- Introduction
- Methodology
- Results
- Conclusion
- Appendix

# Executive Summary

---

- Summary of methodologies
  - Data Collection through API
  - Data Collection with Web Scraping
  - Data Wrangling
  - Exploratory Data Analysis with SQL
  - Exploratory Data Analysis with Data Visualization
  - Interactive Visual Analytics with Folium
  - Machine Learning Prediction
- Summary of all results
  - Exploratory Data Analysis result
  - Interactive analytics in screenshots
  - Predictive Analytics result

# Introduction

---

- Project background and context

Space X advertises Falcon 9 rocket launches on its website with a cost of 62 million dollars; other providers cost upward of 165 million dollars each, much of the savings is because Space X can reuse the first stage. Therefore, if we can determine if the first stage will land, we can determine the cost of a launch. This information can be used if an alternate company wants to bid against space X for a rocket launch. This goal of the project is to create a machine learning pipeline to predict if the first stage will land successfully.

- Problems you want to find answers

- What factors determine if the rocket will land successfully?
- The interaction amongst various features that determine the success rate of a successful landing.
- What operating conditions needs to be in place to ensure a successful landing program.

Section 1

# Methodology

# Methodology

---

## Executive Summary

- Data collection methodology:
  - Data was collected using SpaceX API and web scraping from Wikipedia.
- Perform data wrangling
  - One-hot encoding was applied to categorical features
- Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models
  - How to build, tune, evaluate classification models

# Data Collection

---

## Description of How SpaceX Falcon 9 Data Was Collected

- The data for SpaceX Falcon 9 launches was initially gathered using the SpaceX API, which is a RESTful API. To retrieve the data, a series of helper functions were created to streamline the process of making GET requests to the SpaceX API. These functions utilized the identification numbers associated with each launch to fetch the relevant rocket launch data from the SpaceX API endpoint.
- Once the data was requested, the returned JSON response was parsed for consistency. The data was decoded and converted into a Pandas DataFrame, making it easier to manipulate and analyze.
- Additionally, web scraping was employed to collect Falcon 9's historical launch data from a Wikipedia page titled "List of Falcon 9 and Falcon Heavy launches." The launch records were stored in an HTML table format on the webpage. Using the BeautifulSoup and Requests libraries, the HTML table containing the launch data was extracted and parsed. Finally, the parsed data was converted into a Pandas DataFrame for further analysis.

# Data Collection – SpaceX API

---

- Data collected using SpaceX API (a RESTful API) by making a get request to the SpaceX API then requested and parsed the SpaceX launch data using the GET request and decoded the response content as a Json result which was then converted into a Pandas data frame
- The link to the notebook is  
[https://github.com/Gautham742/Data\\_Science\\_Capstone\\_Project---SpaceX/blob/main/Data\\_Collection\\_API.ipynb](https://github.com/Gautham742/Data_Science_Capstone_Project---SpaceX/blob/main/Data_Collection_API.ipynb)

# Data Collection - Scraping

---

- We applied web scrapping to webscrap Falcon 9 launch records with BeautifulSoup
- We parsed the table and converted it into a pandas dataframe.
- The link to the notebook is  
[https://github.com/Gautham742/Data\\_Science\\_Capstone\\_Project---SpaceX/blob/main/Data\\_Collection\\_Web%20Scraping.ipynb](https://github.com/Gautham742/Data_Science_Capstone_Project---SpaceX/blob/main/Data_Collection_Web%20Scraping.ipynb)

# Data Wrangling

---

Create a training label with landing outcomes where successful = 1 & failure = 0.

Outcome column has two components: ‘Mission Outcome’ ‘Landing Location’

New training label column ‘class’ with a value of 1 if ‘Mission Outcome’ is True and 0 otherwise. Value Mapping:

True ASDS, True RTLS, & True Ocean – set to -> 1

None None, False ASDS, None ASDS, False Ocean, False RTLS – set to -> 0

- The link to the notebook is

[https://github.com/Gautham742/Data\\_Science\\_Capstone\\_Project---SpaceX/blob/main/Data\\_Wrangling.ipynb](https://github.com/Gautham742/Data_Science_Capstone_Project---SpaceX/blob/main/Data_Wrangling.ipynb)

# EDA with Data Visualization

---

Exploratory Data Analysis performed on variables Flight Number, Payload Mass, Launch Site, Orbit, Class and Year.

Plots Used:

- Flight Number vs. Payload Mass, Flight Number vs. Launch Site, Payload Mass vs. Launch Site, Orbit vs. Success Rate, Flight Number vs. Orbit, Payload vs Orbit, and Success Yearly Trend
- Scatter plots, line charts, and bar plots were used to compare relationships between variables to decide if a relationship exists so that they could be used in training the machine learning model
- The link to the notebook is  
[https://github.com/Gautham742/Data\\_Science\\_Capstone\\_Project---SpaceX/blob/main/EDA\\_with\\_Data\\_Visualization.ipynb](https://github.com/Gautham742/Data_Science_Capstone_Project---SpaceX/blob/main/EDA_with_Data_Visualization.ipynb)

# EDA with SQL

---

- We loaded the SpaceX dataset into a PostgreSQL database without leaving the jupyter notebook.
- We applied EDA with SQL to get insight from the data. We wrote queries to find out for instance:
  - The names of unique launch sites in the space mission.
  - The total payload mass carried by boosters launched by NASA (CRS)
  - The average payload mass carried by booster version F9 v1.1
  - The total number of successful and failure mission outcomes
  - The failed landing outcomes in drone ship, their booster version and launch site names.
- The link to the notebook is  
[https://github.com/Gautham742/Data\\_Science\\_Capstone\\_Project--SpaceX/blob/main/EDA\\_with\\_SQL.ipynb](https://github.com/Gautham742/Data_Science_Capstone_Project--SpaceX/blob/main/EDA_with_SQL.ipynb)

# Build an Interactive Map with Folium

---

- We marked all launch sites, and added map objects such as markers, circles, lines to mark the success or failure of launches for each site on the folium map.
- We assigned the feature launch outcomes (failure or success) to class 0 and 1.i.e., 0 for failure, and 1 for success.
- Using the color-labeled marker clusters, we identified which launch sites have relatively high success rate.
- We calculated the distances between a launch site to its proximities. We answered some question for instance:
  - Are launch sites near railways, highways and coastlines.
  - Do launch sites keep certain distance away from cities.
- Here is the link to the Github:  
[https://github.com/Gautham742/Data\\_Science\\_Capstone\\_Project---SpaceX/blob/main/Interactive\\_Visual\\_Analytics\\_with\\_Folium.ipynb](https://github.com/Gautham742/Data_Science_Capstone_Project---SpaceX/blob/main/Interactive_Visual_Analytics_with_Folium.ipynb)

# Build a Dashboard with Plotly Dash

---

- We built an interactive dashboard with Plotly dash
- We plotted pie charts showing the total launches by a certain sites
- We plotted scatter graph showing the relationship with Outcome and Payload Mass (Kg) for the different booster version.
- The link to the notebook is  
[https://github.com/Gautham742/Data\\_Science\\_Capstone\\_Project---SpaceX/blob/main/dash\\_app.py](https://github.com/Gautham742/Data_Science_Capstone_Project---SpaceX/blob/main/dash_app.py)

# Predictive Analysis (Classification)

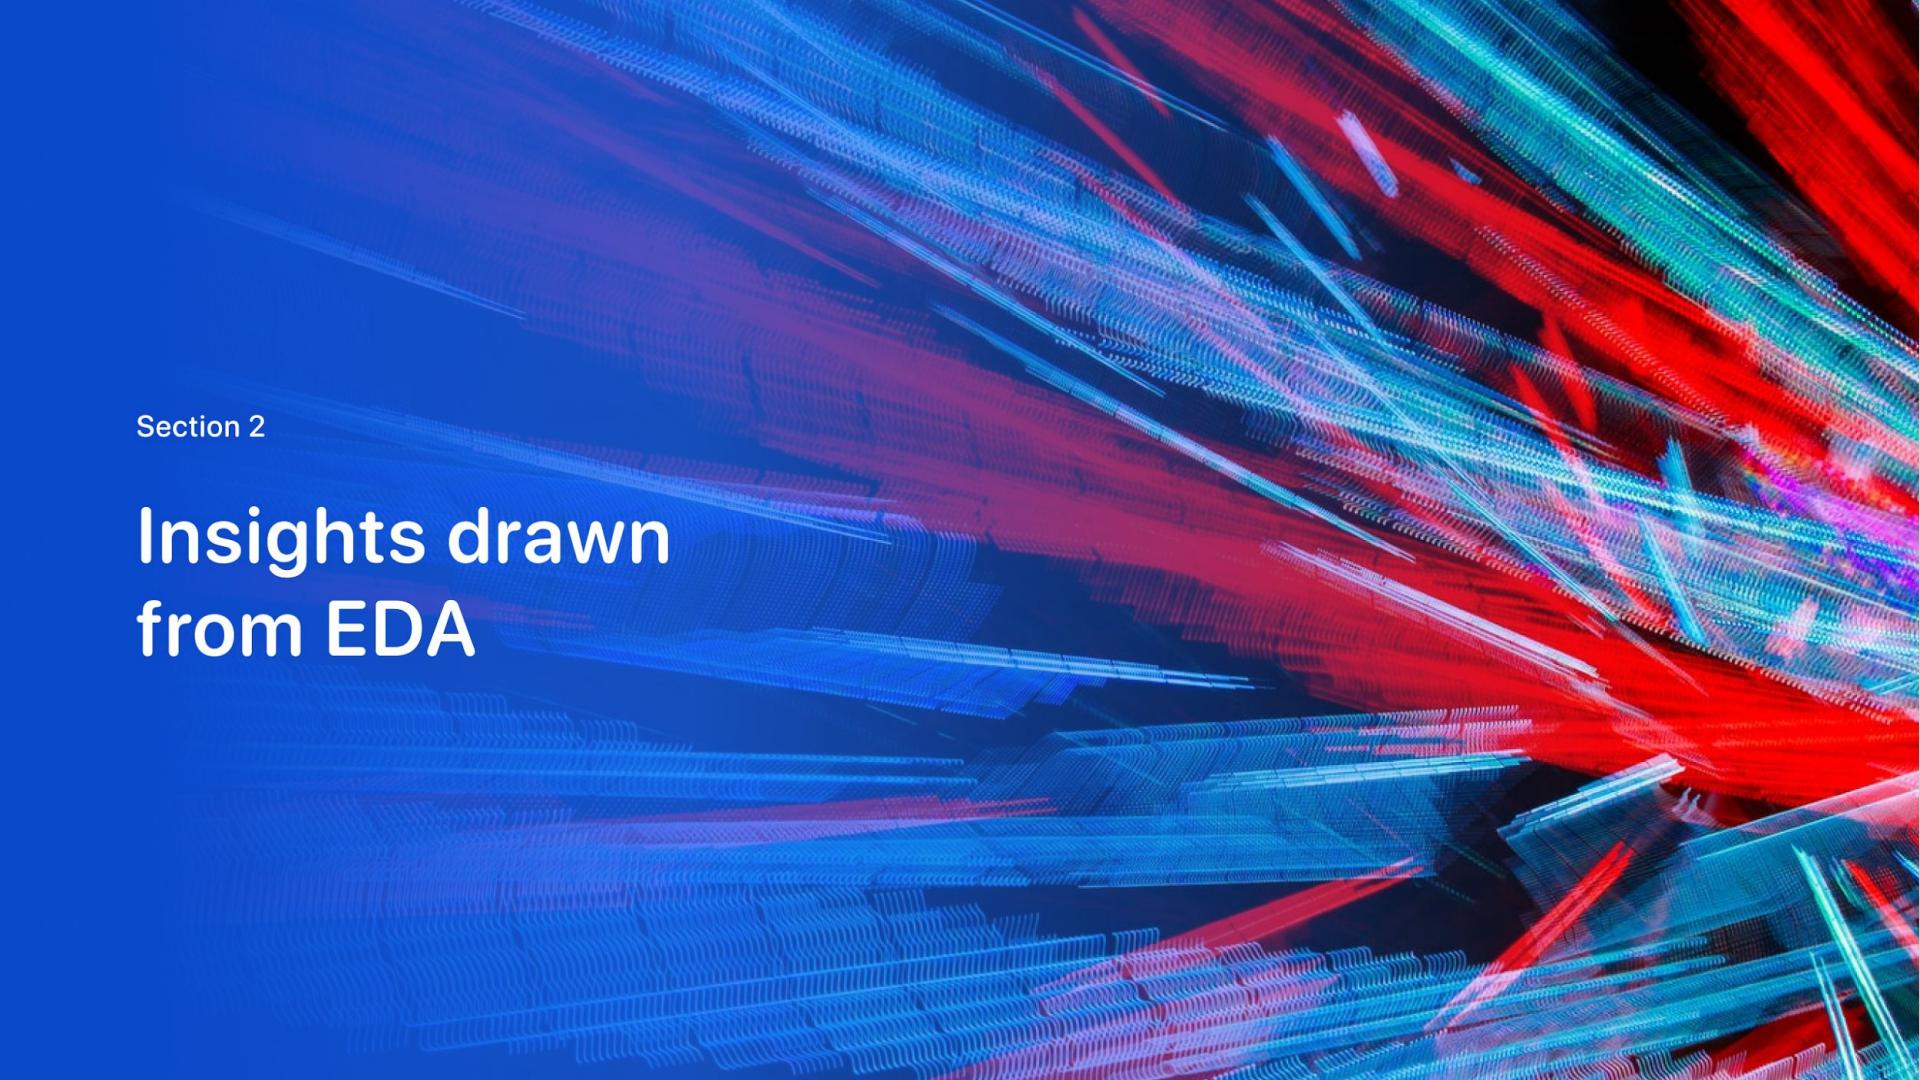

---

- We loaded the data using numpy and pandas, transformed the data, split our data into training and testing.
- We built different machine learning models and tune different hyperparameters using GridSearchCV.
- We used accuracy as the metric for our model, improved the model using feature engineering and algorithm tuning.
- We found the best performing classification model.
- The link to the notebook is  
[https://github.com/Gautham742/Data\\_Science\\_Capstone\\_Project---SpaceX/blob/main/Machine\\_Learning\\_Prediction.ipynb](https://github.com/Gautham742/Data_Science_Capstone_Project---SpaceX/blob/main/Machine_Learning_Prediction.ipynb)

# Results

---

- Exploratory data analysis results
- Interactive analytics demo in screenshots
- Predictive analysis results

The background of the slide features a dynamic, abstract pattern of glowing lines. These lines are primarily blue and red, creating a sense of motion and depth. They appear to be composed of numerous small, glowing dots or particles, forming wavy, undulating shapes that curve across the frame. The overall effect is reminiscent of a digital or futuristic landscape.

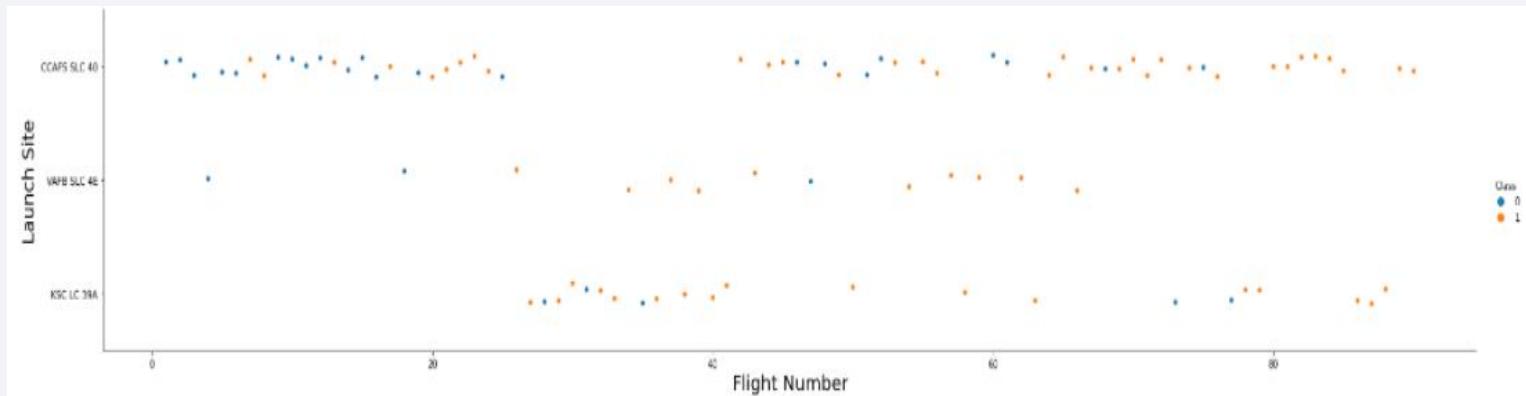

Section 2

## Insights drawn from EDA

# Flight Number vs. Launch Site

---

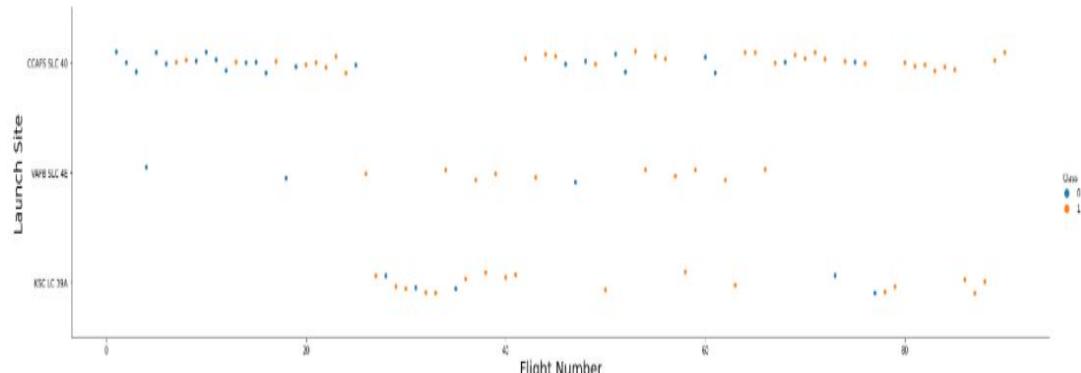

- From the plot, we found that the larger the flight amount at a launch site, the greater the success rate at a launch site.

# Payload vs. Launch Site

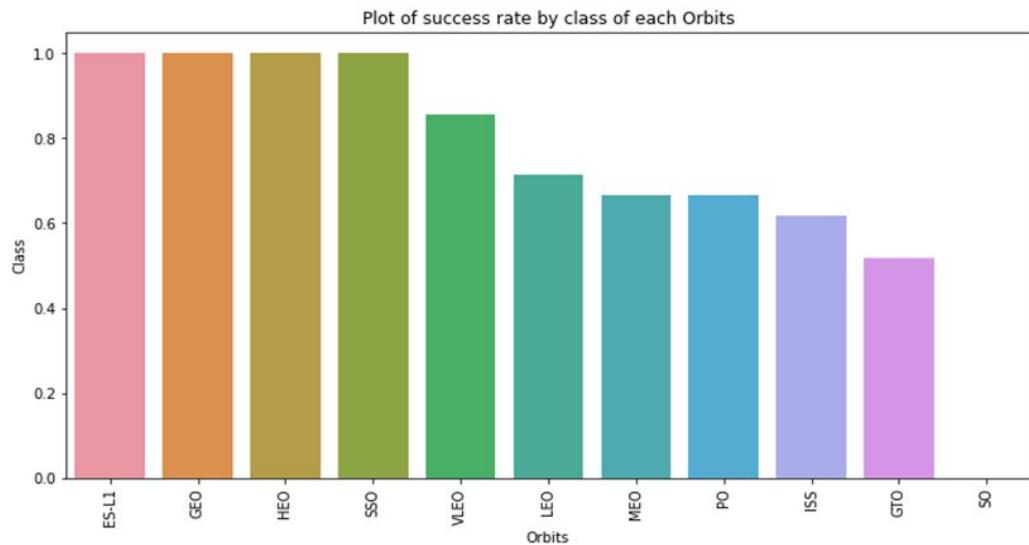

The greater the payload mass for launch site CCAFS SLC 40 the higher the success rate for the rocket.

# Success Rate vs. Orbit Type

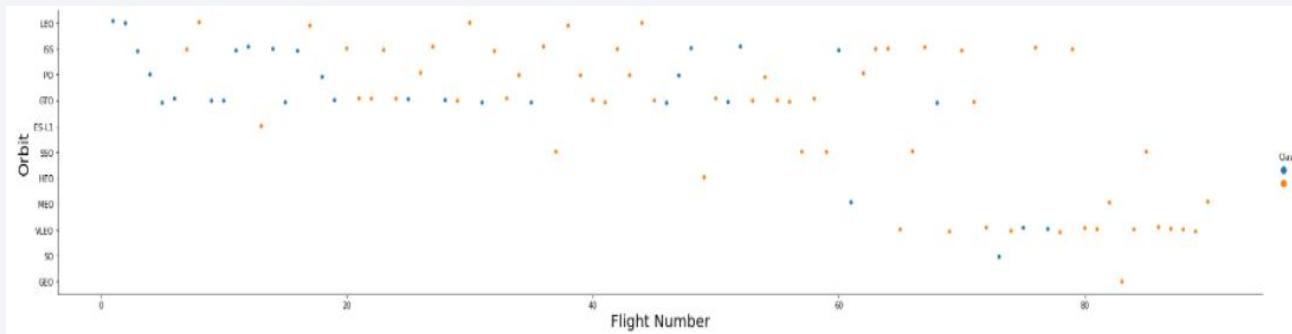

- From the plot, we can see that ES-L1, GEO, HEO, SSO, VLEO had the most success rate.

# Flight Number vs. Orbit Type

---

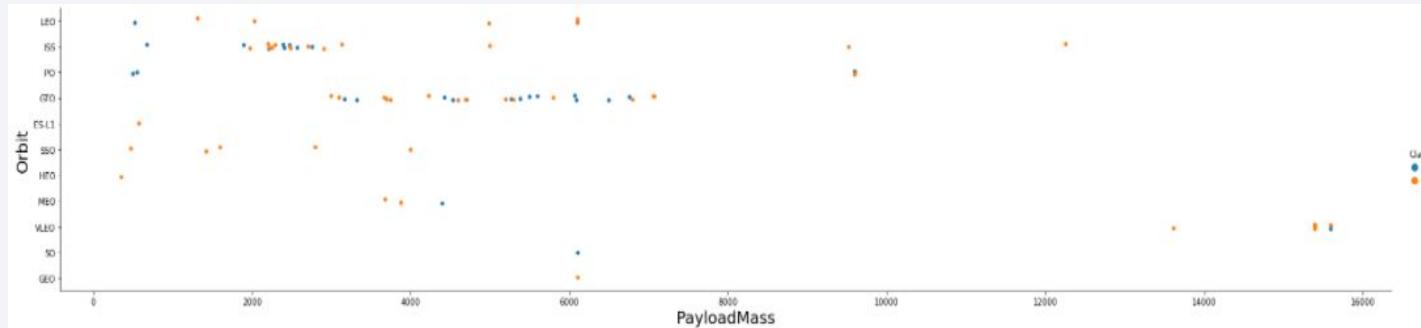

- The plot below shows the Flight Number vs. Orbit type. We observe that in the LEO orbit, success is related to the number of flights whereas in the GTO orbit, there is no relationship between flight number and the orbit.

# Payload vs. Orbit Type

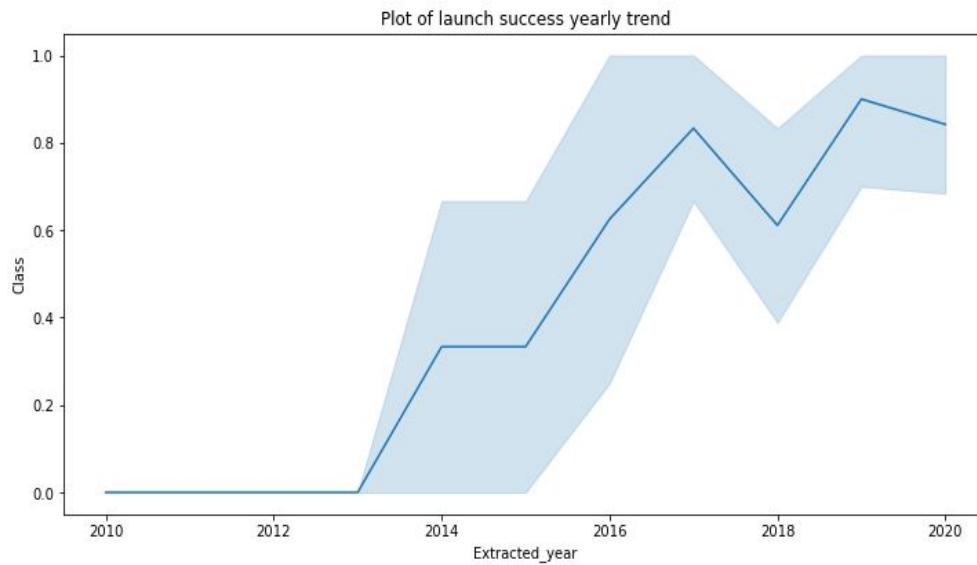

---

- We can observe that with heavy payloads, the successful landing are more for PO, LEO and ISS orbits.

# Launch Success Yearly Trend

- From the plot, we can observe that success rate since 2013 kept on increasing till 2020.

# All Launch Site Names

- We used the key word **DISTINCT** to show only unique launch sites from the SpaceX data.

Display the names of the unique launch sites in the space mission

In [10]:

```
task_1 = ''''  
SELECT DISTINCT LaunchSite  
FROM SpaceX  
'''  
  
create_pandas_df(task_1, database=conn)
```

Out[10]:

launchsite

0	KSC LC-39A
1	CCAFS LC-40
2	CCAFS SLC-40
3	VAFB SLC-4E

# Launch Site Names Begin with 'CCA'

```
Display 5 records where launch sites begin with the string 'CCA'

In [11]: task_2 = """
    SELECT *
    FROM SpaceX
    WHERE LaunchSite LIKE 'CCA%'
    LIMIT 5
"""
create_pandas_df(task_2, database=conn)

Out[11]:
```

	date	time	boosterversion	launchsite	payload	payloadmasskg	orbit	customer	missionoutcome	landingoutcome
0	2010-04-06	18:45:00	F9 v1.0 B0003	CCAFS LC-40	Dragon Spacecraft Qualification Unit	0	LEO	SpaceX	Success	Failure (parachute)
1	2010-08-12	15:43:00	F9 v1.0 B0004	CCAFS LC-40	Dragon demo flight C1, two CubeSats, barrel of...	0	LEO (ISS)	NASA (COTS) NRO	Success	Failure (parachute)
2	2012-05-22	07:44:00	F9 v1.0 B0005	CCAFS LC-40	Dragon demo flight C2	525	LEO (ISS)	NASA (COTS)	Success	No attempt
3	2012-08-10	00:35:00	F9 v1.0 B0006	CCAFS LC-40	SpaceX CRS-1	500	LEO (ISS)	NASA (CRS)	Success	No attempt
4	2013-01-03	15:10:00	F9 v1.0 B0007	CCAFS LC-40	SpaceX CRS-2	677	LEO (ISS)	NASA (CRS)	Success	No attempt

- We used the query above to display 5 records where launch sites begin with 'CCA'

# Total Payload Mass

---

- We calculated the total payload carried by boosters from NASA as 45596 using the query below

Display the total payload mass carried by boosters launched by NASA (CRS)

```
In [12]: task_3 = """
    SELECT SUM(PayloadMassKG) AS Total_PayloadMass
    FROM SpaceX
    WHERE Customer LIKE 'NASA (CRS)'
    ...
create_pandas_df(task_3, database=conn)
```

Out[12]: total\_payloadmass

	total_payloadmass
0	45596

# Average Payload Mass by F9 v1.1

- We calculated the average payload mass carried by booster version F9 v1.1 as 2928.4

Display average payload mass carried by booster version F9 v1.1

```
In [13]: task_4 = """
    SELECT AVG(PayloadMassKG) AS Avg_PayloadMass
    FROM SpaceX
    WHERE BoosterVersion = 'F9 v1.1'
"""
create_pandas_df(task_4, database=conn)
```

```
Out[13]: avg_payloadmass
          0      2928.4
```

# First Successful Ground Landing Date

- We observed that the dates of the first successful landing outcome on ground pad was 22<sup>nd</sup> December 2015

```
In [14]: task_5 = """
    SELECT MIN(Date) AS FirstSuccessfull_landing_date
    FROM SpaceX
    WHERE LandingOutcome LIKE 'Success (ground pad)'
"""

create_pandas_df(task_5, database=conn)
```

```
Out[14]: firstsuccessfull_landing_date
0           2015-12-22
```

# Successful Drone Ship Landing with Payload between 4000 and 6000

In [15]:

```
task_6 = """
    SELECT BoosterVersion
    FROM SpaceX
    WHERE LandingOutcome = 'Success (drone ship)'
        AND PayloadMassKG > 4000
        AND PayloadMassKG < 6000
"""
create_pandas_df(task_6, database=conn)
```

Out[15]:

	boosterversion
0	F9 FT B1022
1	F9 FT B1026
2	F9 FT B1021.2
3	F9 FT B1031.2

- We used the **WHERE** clause to filter for boosters which have successfully landed on drone ship and applied the **AND** condition to determine successful landing with payload mass greater than 4000 but less than 6000

# Total Number of Successful and Failure Mission Outcomes

List the total number of successful and failure mission outcomes

```
In [16]: task_7a = """
    SELECT COUNT(MissionOutcome) AS SuccessOutcome
    FROM SpaceX
    WHERE MissionOutcome LIKE 'Success%'
    """

task_7b = """
    SELECT COUNT(MissionOutcome) AS FailureOutcome
    FROM SpaceX
    WHERE MissionOutcome LIKE 'Failure%'
    """

print('The total number of successful mission outcome is:')
display(create_pandas_df(task_7a, database=conn))
print()
print('The total number of failed mission outcome is:')
create_pandas_df(task_7b, database=conn)
```

The total number of successful mission outcome is:

successoutcome
0
100

The total number of failed mission outcome is:

failureoutcome
0
1

- We used wildcard like '%' to filter for **WHERE** MissionOutcome was a success or a failure.

# Boosters Carried Maximum Payload

- We determined the booster that have carried the maximum payload using a subquery in the **WHERE** clause and the **MAX()** function.

List the names of the booster\_versions which have carried the maximum payload mass. Use a subquery

In [17]:

```
task_8 = """
    SELECT BoosterVersion, PayloadMassKG
    FROM SpaceX
    WHERE PayloadMassKG = (
        SELECT MAX(PayloadMassKG)
        FROM SpaceX
    )
    ORDER BY BoosterVersion
"""
create_pandas_df(task_8, database=conn)
```

Out[17]:

	boosterversion	payloadmasskg
0	F9 B5 B1048.4	15600
1	F9 B5 B1048.5	15600
2	F9 B5 B1049.4	15600
3	F9 B5 B1049.5	15600
4	F9 B5 B1049.7	15600
5	F9 B5 B1051.3	15600
6	F9 B5 B1051.4	15600
7	F9 B5 B1051.6	15600
8	F9 B5 B1056.4	15600
9	F9 B5 B1058.3	15600
10	F9 B5 B1060.2	15600
11	F9 B5 B1060.3	15600

# 2015 Launch Records

---

- We used a combinations of the **WHERE** clause, **LIKE**, **AND**, and **BETWEEN** conditions to filter for failed landing outcomes in drone ship, their booster versions, and launch site names for year 2015

```
List the failed landing_outcomes in drone ship, their booster versions, and launch site names for in year 2015
```

```
In [18]: task_9 = """
    SELECT BoosterVersion, LaunchSite, LandingOutcome
    FROM SpaceX
    WHERE LandingOutcome LIKE 'Failure (drone ship)'
        AND Date BETWEEN '2015-01-01' AND '2015-12-31'
    ...
create_pandas_df(task_9, database=conn)
```

```
Out[18]:   boosterversion  launchsite  landingoutcome
0      F9 v1.1 B1012  CCAFS LC-40  Failure (drone ship)
1      F9 v1.1 B1015  CCAFS LC-40  Failure (drone ship)
```

# Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

Rank the count of landing outcomes (such as Failure (drone ship) or Success (ground pad))

In [19]:

```
task_10 = ...  
SELECT LandingOutcome, COUNT(LandingOutcome)  
FROM SpaceX  
WHERE DATE BETWEEN '2010-06-04' AND '2017-03-20'  
GROUP BY LandingOutcome  
ORDER BY COUNT(LandingOutcome) DESC  
...  
create_pandas_df(task_10, database=conn)
```

Out[19]:

	landingoutcome	count
0	No attempt	10
1	Success (drone ship)	6
2	Failure (drone ship)	5
3	Success (ground pad)	5
4	Controlled (ocean)	3
5	Uncontrolled (ocean)	2
6	Precluded (drone ship)	1
7	Failure (parachute)	1

- We selected Landing outcomes and the **COUNT** of landing outcomes from the data and used the **WHERE** clause to filter for landing outcomes **BETWEEN** 2010-06-04 to 2010-03-20.
- We applied the **GROUP BY** clause to group the landing outcomes and the **ORDER BY** clause to order the grouped landing outcome in descending order.

The background of the slide is a photograph taken from space at night. It shows the curvature of the Earth against a dark blue-black void of space. City lights are visible as numerous small white and yellow dots, primarily concentrated in the lower half of the image where continents appear. In the upper right quadrant, there is a bright, horizontal band of light green and yellow, characteristic of the aurora borealis or southern lights. A few small stars are scattered across the dark sky.

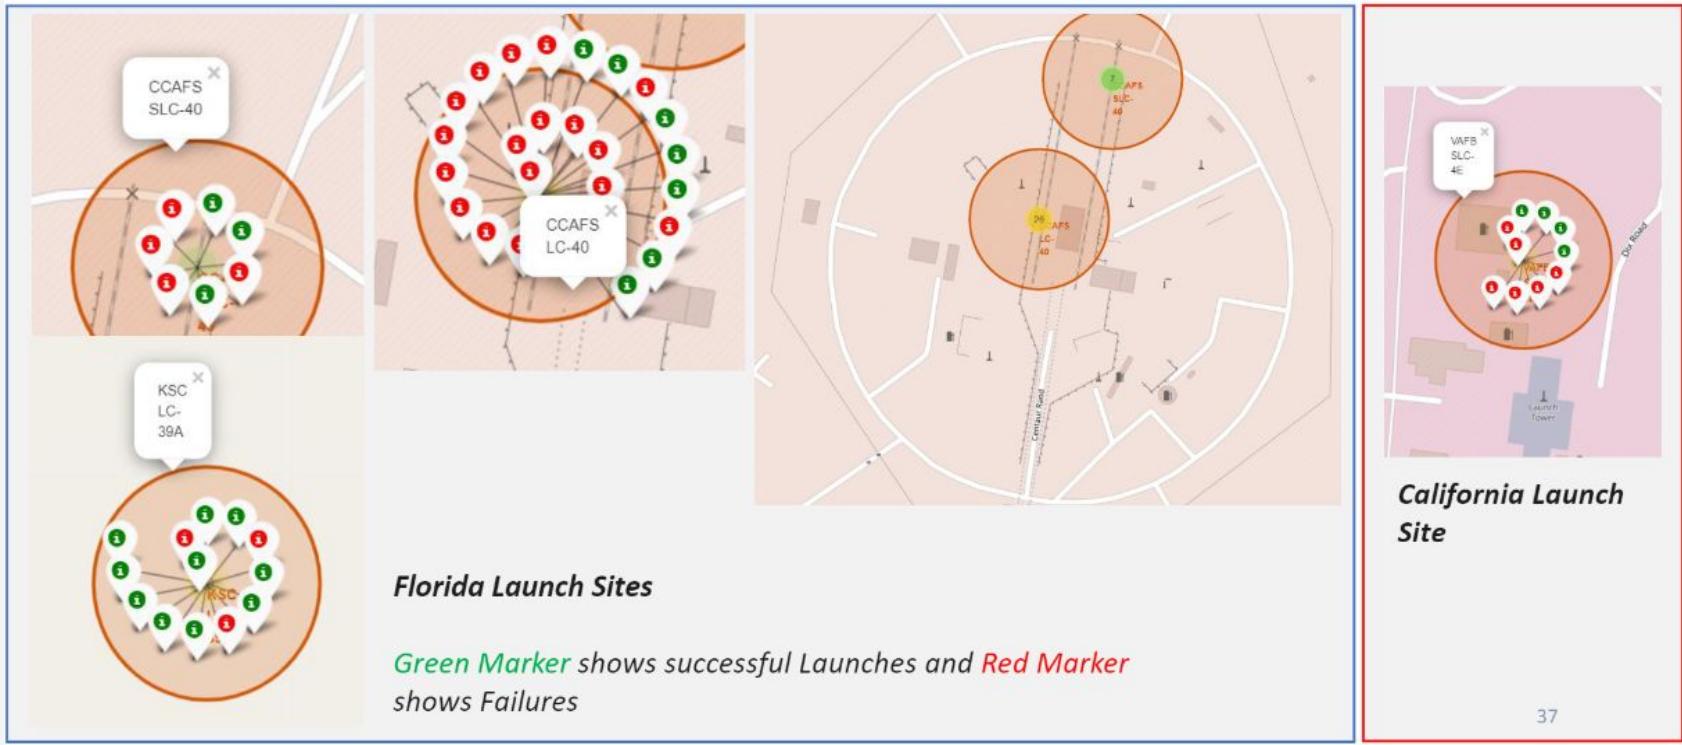

Section 4

# Launch Sites Proximities Analysis

# All launch sites global map markers

# Markers showing launch sites with color labels

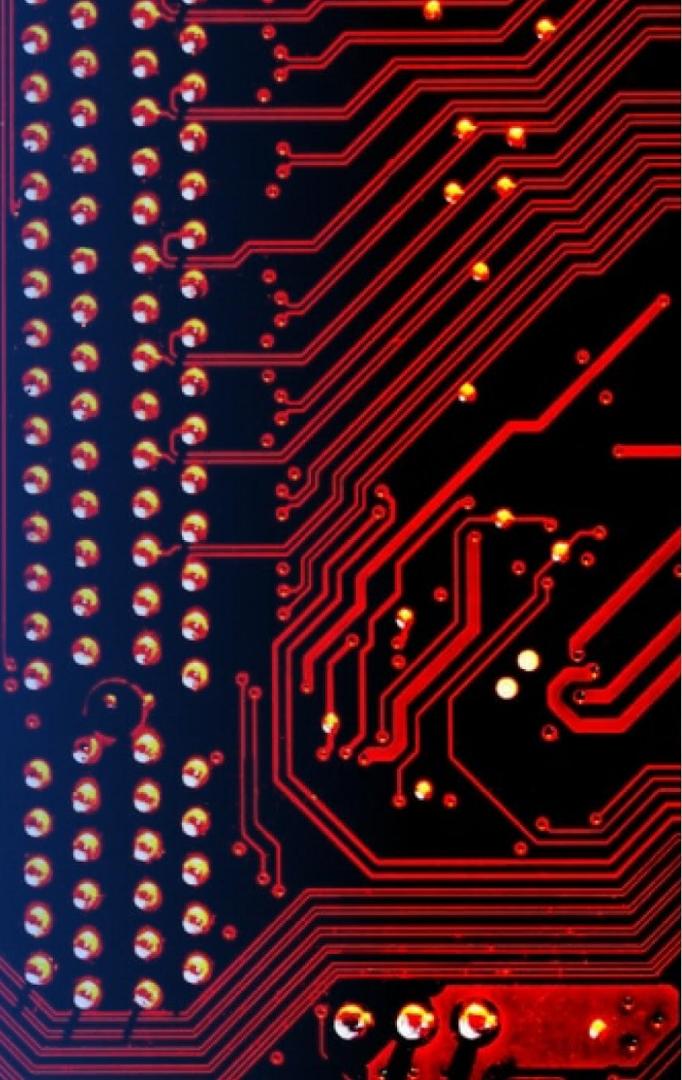

# Launch Site distance to landmarks

- Are launch sites in close proximity to railways? No
  - Are launch sites in close proximity to highways? No
  - Are launch sites in close proximity to coastline? Yes
  - Do launch sites keep certain distance away from cities? Yes

Section 5

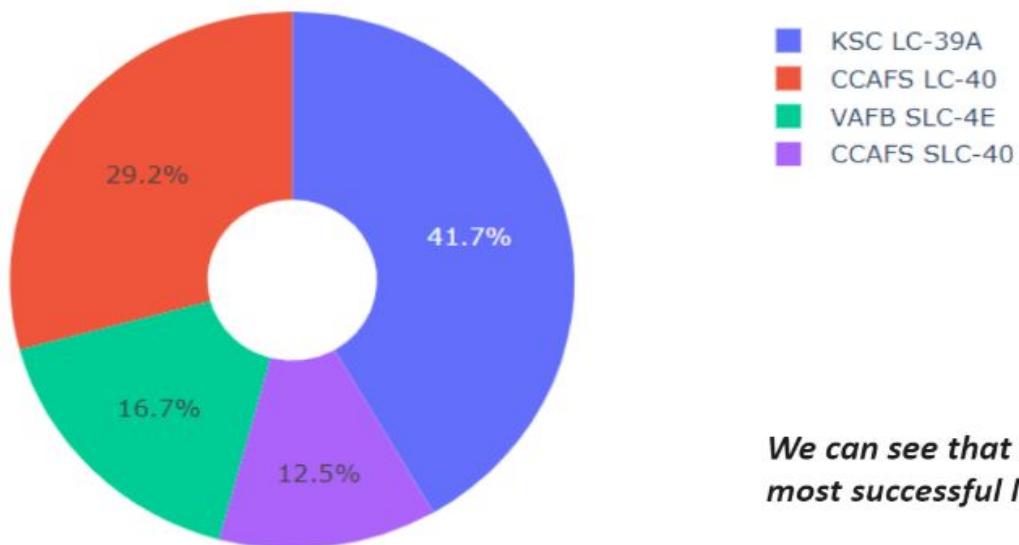

# Build a Dashboard with Plotly Dash

## Pie chart showing the success percentage achieved by each launch site

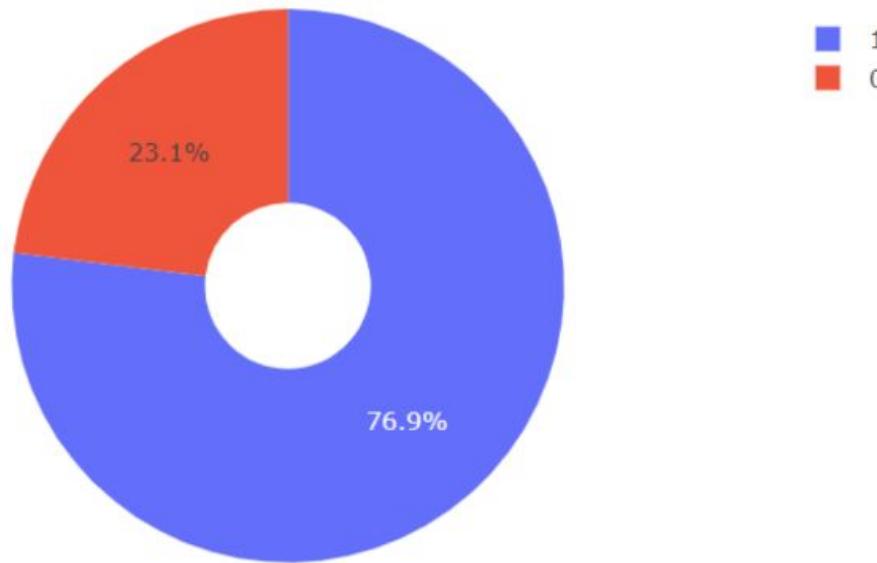

---

Total Success Launches By all sites

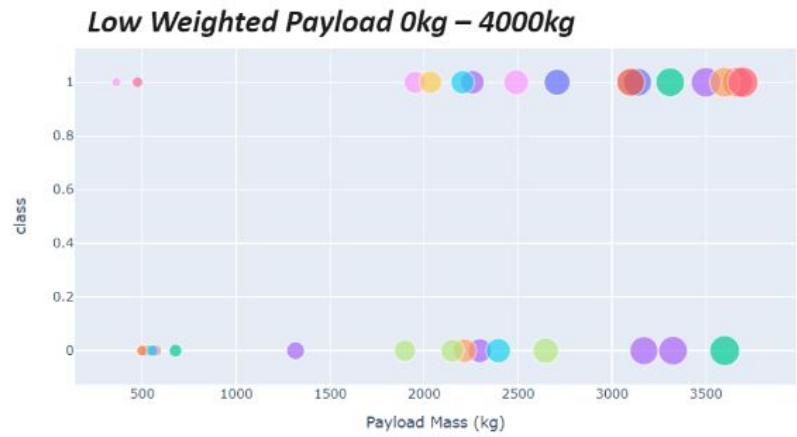

*We can see that KSC LC-39A had the most successful launches from all the sites*

## Pie chart showing the Launch site with the highest launch success ratio

*KSC LC-39A achieved a 76.9% success rate while getting a 23.1% failure rate*

# Scatter plot of Payload vs Launch Outcome for all sites, with different payload selected in the range slider

The background of the slide features a dynamic, blurred motion effect. It consists of several curved, overlapping bands of color and light. The primary colors are shades of blue and white, creating a sense of speed and depth. A single yellow line is visible on the left side, and a series of small white dots is visible on the right side, suggesting a perspective view through a tunnel or a window.

Section 6

# Predictive Analysis (Classification)

# Classification Accuracy

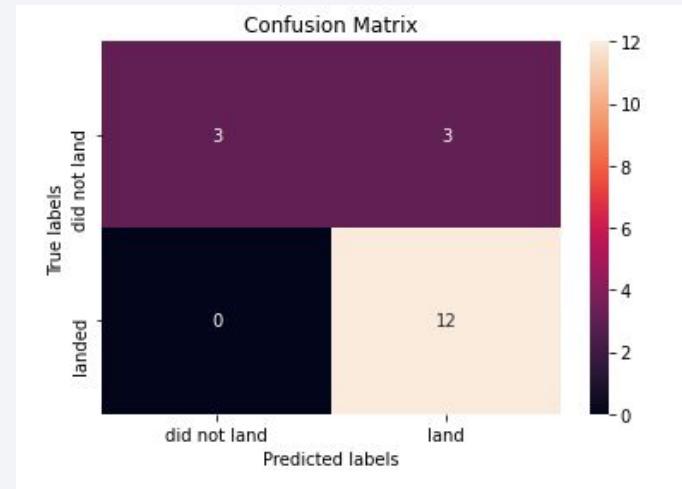

- The decision tree classifier is the model with the highest classification accuracy

```
models = {'KNeighbors':knn_cv.best_score_,  
          'DecisionTree':tree_cv.best_score_,  
          'LogisticRegression':logreg_cv.best_score_,  
          'SupportVector': svm_cv.best_score_}  
  
bestalgorithm = max(models, key=models.get)  
print('Best model is', bestalgorithm, 'with a score of', models[bestalgorithm])  
if bestalgorithm == 'DecisionTree':  
    print('Best params is :', tree_cv.best_params_)  
if bestalgorithm == 'KNeighbors':  
    print('Best params is :', knn_cv.best_params_)  
if bestalgorithm == 'LogisticRegression':  
    print('Best params is :', logreg_cv.best_params_)  
if bestalgorithm == 'SupportVector':  
    print('Best params is :', svm_cv.best_params_)  
  
Best model is DecisionTree with a score of 0.8732142857142856  
Best params is : {'criterion': 'gini', 'max_depth': 6, 'max_features': 'auto', 'min_samples_leaf': 2, 'min_samples_split': 5, 'splitter': 'random'}
```

# Confusion Matrix

---

- The confusion matrix for the decision tree classifier shows that the classifier can distinguish between the different classes. The major problem is the false positives .i.e., unsuccessful landing marked as successful landing by the classifier.

# Conclusions

---

We can conclude that:

- The larger the flight amount at a launch site, the greater the success rate at a launch site.
- Launch success rate started to increase in 2013 till 2020.
- Orbits ES-L1, GEO, HEO, SSO, VLEO had the most success rate.
- KSC LC-39A had the most successful launches of any sites.
- The Decision tree classifier is the best machine learning algorithm for this task.

Thank you!
